

Location Map

Viewing platform located at Carcoar Dam

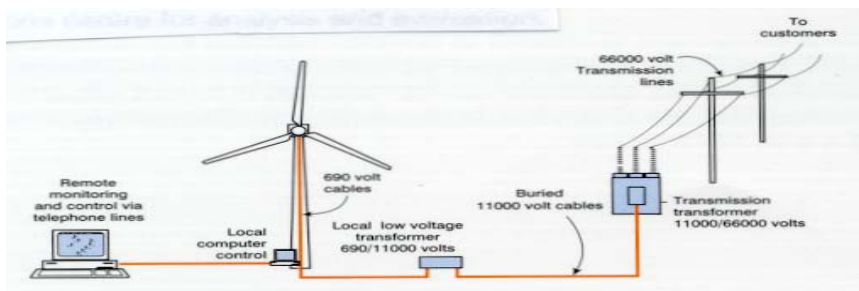

Each turbine is regulated to ensure that the wind farm operates at the maximum possible output for all situations. Each turbine has its own local computer control system that optimises its own energy output.

Data on the performance of each wind turbine is continually collected and transferred to the operations centre for analysis and evaluation.

Erection of wind rotor and massive crane assembling a tower at the Blayney Wind Farm

A communications link between the wind farm and the operations centre allows the operators to monitor and control each wind turbine independently if required.
